DATA ANALYSIS

27-04-2026

- ① Business Analytics - Application of computing technologies and statistic methods for collecting, processing and analysing information to help make insightful decisions in business.
E.g Customer relation management.
Source: AI Overview
- ② Data Analysis - Transforming ~~data~~ raw data through a process of collection, ~~and~~ cleaning and processing. By interpreting data sets we are able to resolve business challenges using tools like SQL.
E.g of data analysis: Sale trend analysis.
Source AI Overview.
- ③ Business Intelligence - The ability for business organization to use data analysis outcomes to make strategic and insightful business decisions and solve business challenges
E.g Netflix accounts
Source: AI Overview.
4. Data Driven decision making - The process of using proven data analysis outputs to make decisions as oppose to making business decisions based on assumptions.
E.g Health: patient diagnosis are made after proving that the data collected is correct.
Source: AI Overview

⑤ Big data - Large, complicated and often growing database that overlaps the capacity of traditional data processing systems like Spreadsheet. Often real time based data collection.
e.g. Uber uses data on an ongoing bases.
Source: AI Overview.

⑥ Descriptive Analytics - A process of using present and past data to develop a trend pattern.
e.g. Financial statement: can be used to monitor spending trends.
Source: AI Overview

⑦ Diagnostic Analysis - The process of ~~asse~~ accessing data, to be able pinpoint the actual cause of a trend, anomalies for a particular outcome.
e.g. Operational failure - detecting what could be slowing down production i.e. employee's strike.
Source: AI Overview.

8. Predictive - The prediction of future outcome of business based on recommendation that is derived from using high level of data analysis methods.
e.g. fraud detection.
Source: AI Overview.

9. Prescriptive analysis - A solution based method used to process data to help come up with solutions for problems that might arise in the future.
Source: AI Overview.

10. ~~Data literacy~~ - The ability to read, work
Data literacy - The ability to interpret, apply and work with data. To understand the process of how it was collected, cleaned and interpreted and how to present it.
Source: Databricks.com.
11. Structured data - Information that highly organized data, usually arranged in tables for example Excel spreadsheets.
12. Unstructured data - Raw data that is not easy to read or does not follow a particular format like a table e.g email and photo
Source: AI overview.
13. Datawarehouse - A data storage hub that host data from different data storage and sources
e.g Health care - Capturing patient information from different clinics.
Source: AI overview.
14. Data mining - A process of discovering patterns and trend from big data sets using machine learning
e.g retail and e-commerce - shows which items are usually bought as combis i.e bread and eggs.
15. Data visualization - The final outlook of data presentation after collecting, cleaning and processing data, data visualization is easy to understand.
e.g linegraphs
